

"Automatic Reference Note Generator"

ABSTRACT OF THE DISCLOSURE

[0090] Content is transferred from one computer resource to another computer
5 resource by receiving a first insertion point or replacement area from a first user
interface to a destination computer resource, receiving an enablement to perform
automatic paste operation, switching to a user interface to a source computer
resource, receiving a user selection of content from said source user interface, and
automatically copying the selected content to a transfer buffer and to the designated
10 insertion point(s) in the destination computer resource. Each time source content is
selected, a number of source reference data items such as author, publication date,
and source file name or network address are captured and stored. The stored source
reference identifies may then be used to automatically generate footnotes, end notes,
and bibliographical entries.
